

How do I display my MacBook on the SmartBoard or projector? Function F4 doesn't work on my Mac.

No worries, there is a keyboard shortcut for this on the Mac too.

Command-F1 will mirror the display of your laptop on the SmartBoard or projector (same on both screens). Press **Command-F1** twice and it will extend your display. You can then drag program windows to your SmartBoard and the students will not see the program windows on your MacBook.
